Streamlining IT Procurement: Automating Standard Laptop Orders with IT Procurement

A customer journey map visualizes the steps an employee goes through when requesting a standard laptop through IT procurement. It captures what the employee does, who and what they interact with, what they want to achieve, and where the experience is positive or frustrating.

By mapping the journey from the first need for a laptop to delivery and follow-up, the team can identify delays, manual effort and unclear approvals, and find opportunities to automate standard laptop orders with predefined configurations, approval workflows and vendor integration.

SCENARIO **Requesting, approving, ordering and receiving a standard laptop**	**Entice** How does an employee become aware of the need for a laptop?	**Enter** What do people experience as they begin the request?	**Engage** In the core moments of the process, what happens?	**Exit** What do people experience as the process finishes?	**Extend** What happens after the laptop is delivered?
Steps What does the employee typically experience?	New joiner is onboarded or the old laptop is due for replacement Employee or manager learns that a laptop must be requested	Employee opens the IT service portal and selects "Request a Laptop" Chooses a standard model and submits the request	Request is routed to the manager for approval Approved request triggers an automated purchase order to the vendor Employee receives order status updates	Laptop is delivered and handed over by IT Employee signs the acknowledgement and starts working	Asset is recorded in the inventory automatically Employee shares feedback; procurement reviews order data
Interactions People, places and things at each step	People: HR team, reporting manager Places: Email, onboarding checklist Things: Onboarding email, old laptop	People: IT service desk Places: IT service portal (web or mobile) Things: Laptop catalogue, request form	People: Manager, procurement team, vendor Places: Portal, email and chat notifications Things: Approval workflow, purchase order	People: IT support engineer Places: Office or delivery address Things: New laptop, acknowledgement form	People: Procurement team, asset manager Places: Asset management system Things: Feedback survey, order reports
Goals & motivations "Help me..." or "Help me avoid..."	Help me know exactly how to get the laptop I need	Help me find the right standard laptop quickly without filling multiple forms	Help me get approval fast and see where my order is	Help me receive a ready-to-use laptop on time	Help me get a smoother, faster process next time
Positive moments What is enjoyable, productive or delightful?	Clear onboarding instructions make the next step obvious	A simple catalogue with predefined standard configurations makes choosing easy	Automatic approvals and order tracking remove the need for follow-ups	Receiving a new laptop that is set up and ready to use	Laptop details are recorded automatically and feedback is quick to give

SCENARIO **Requesting, approving, ordering and receiving a standard laptop**	**Entice** How does an employee become aware of the need for a laptop?	**Enter** What do people experience as they begin the request?	**Engage** In the core moments of the process, what happens?	**Exit** What do people experience as the process finishes?	**Extend** What happens after the laptop is delivered?
Negative moments What is frustrating, confusing or time-consuming?	Employees are unsure whom to contact or which laptop to ask for	Multiple forms and unclear specifications cause errors and rework	Approvals get stuck in email threads; no visibility of order status; repeated follow-ups	Delayed delivery leaves the employee idle or working on an old laptop	Inventory records are updated manually; feedback is rarely collected
Areas of opportunity How might we make each step better?	Trigger the laptop request automatically from the HR onboarding record	Offer a one-click "Standard Laptop" catalogue item with prefilled specifications	Automate approval routing, reminders, vendor order placement and status notifications	Show delivery estimates and shipment tracking in the portal	Auto-update the asset inventory and use order data and feedback to improve
